

## EXPRESS-G for General Property assignment to annotation occurrences

**Note:** If one wants to attach general properties to entities `product_definition`, `product_definition_shape` or `shape_aspect` including subtypes, the select types `shape_definition` and `characterized_product_definition`, which appear in the select list of `characterized_definition` enable this. So this mechanism is a general mechanism to assign general properties. The values of `name` and `description` attributes however will then be different to what is shown in this diagram.
